

Removing the ABS ring from Renault Laguna / Megane brake disc

Follow the instructions of the vehicle manufacturer to remove and install the brake discs.

The ABS ring must be extracted evenly from the old brake disc using a suitable puller(see photo).

The puller should have the capability of being used within a range of 22-115 mm.

Once removed the ring should be cleaned and refitted to the new brake disc, only slight pressure should be required.

Caution: Damage to the magnetic segments may result if the ring is seized or deformed in any way. Improper assembly can lead to failure of the ABS.
